**Sital Daryanani : Building Systems Design with Programmable Calculators** before purchasing it in order to gage whether or not it would be worth my time, and all praised Building Systems Design with Programmable Calculators:

Have often thought that reproducing these as spreadsheets would be a nice "second edition." Daryanani knew his stuff, and was a great engineer.1 of 1 people found the following review helpful. Nice bookBy A CustomerThis book was published by McGraw Hill in 1980. It has chapters on pipe sizing, air ducts, lighting, sanitary systems, heat transmission, solar energy, and others.It has fully documented hand calculator programs that the user can enter into a programmable hand or simulated HP computer calculator (several are now available). Works with HP scientific calculators. Shows all formulas and how to apply them. You can even rewrite the models in Basic.

This is the book that unlocks the vast potential of programmable calculators in building design. Any designer who knows how to use a programmable calculator can now save countless hours solving the most commonly encountered problems while finding optimum solutions.
